

## BRACKETS

### WALL BRACKETS

All of our wall brackets are made of galvanised steel, finished in a thermoplastic paint colour of your choice. The brackets are designed to be fitted to a wall with expanding wall bolts, but can be fitted with other methods, depending on your wall material.

The basic tube bracket is simple and cost effective made from steel tube designed to support any lantern with a standard 76mm spigot.

Our most popular bracket is the wall mounted cradle bracket, it is both functional and decorative and can be made to hold any size lantern. The style pictured here suits our Hampstead lantern but it can be styled to suit your own lanterns.

### POST TOP

Our swan neck and hoop brackets are made from tubular steel with decorative cast LM25 aluminium knuckle (pictured here with a railway lantern). They have standard sized fittings to accept any commercially available lantern.

We can also produce an offset bracket which allows you to move your lantern without moving the column. This places the lantern away from interference with walls or lorry strikes.
